__ Precise
__ Excellent hemostasis
__ Versatile
__ Working in non-contact or contact
bionitec®
laser therapies in Gynecology

The bionitec® diode laser systems are characterized by a compact, maintenance-free design for effective and safe use in surgery. Since almost 20 years bionitec® has been developing methods and procedures in many medical disciplines and offers established and sophisticated devices with a selection of optical fibers for different applications. The laser systems used worldwide are developed in Germany at the Bonn location and are characterized by high quality and safety standards. Whether in the operating room or in the outpatient OR center, the use of bionitec® diode lasers significantly expands the spectrum of users.

In gynecology, bionitec® offers a wide range of treatment options in both hysteroscopy and laparoscopy. Myomas, polyps, dysplasia, cysts and condylomas can be treated by cutting, enucleation, vaporization and coagulation. Controlled cutting with laser light has hardly any effect on the uterine muscles and thus avoids painful contractions. The simultaneous coagulation guarantees excellent hemostasis and therefore a good view on the surgical field at all times. The defined penetration depth allows very precise and tissue-friendly working and is therefore the method of treatment with a great contribution to preserving fertility.

Easy to use, precise & versatile in
__ Hysteroscopy  
__ Laparoscopy and  
__ minimally-invasive surgery
The 1470 nm/980 nm wavelengths ensure high absorption in water and hemoglobin. The thermal penetration depth is significantly lower than, for example, the thermal penetration depth with Nd: YAG lasers. These effects enable safe and precise laser applications to be performed near sensitive structures while providing thermal protection of the surrounding tissue. Compared to the CO₂ laser, these special wavelengths offer significantly better hemostasis and prevent major bleeding during surgery, even in hemorrhagic structures.

With thin, flexible glass fibers you have very good and precise control of the laser beam. The penetration of laser energy into deep structures is avoided and surrounding tissue is not affected. Working with quartz glass fibers in non-contact and contact offers tissue-friendly cutting, coagulation and vaporization.

**LEONARDO® DUAL**

**Easy**
- Easy handling
- Reduced surgery time

**Safe**
- Intuitive interface
- RFID for sterility assurance
- Defined penetration depth

**Flexible**
- Contact- or non-contact with tactile feedback
- Cutting, coagulation, hemostasis
HOLA® – Hysteroscopic Outpatient Laser Application

About one third of all women aged 30 and over is affected by myomas. The gentle and above all uterine preserving treatment of myomas is especially important for women who wish to have children.

Myomas can be enucleated quickly and gently with the MyoFiber® glass fibers in a variety of designs. The use of standard diagnostic hysteroscopes with small diameter allows direct treatment during diagnosis. The laser energy avoids contraction of the uterine muscles and can therefore be used without or under minimal local anesthesia. The extremely gentle intervention with continuous irrigation with saline solution ensures a quick return to normal activities.

**Advantages**
- Safe working in saline solution
- Outpatient possible without anesthesia
- Use of standard instruments
- Almost painless for patients

**Applications**
- Myoma
- Polyp
- Septum
- Isthmocele

**Instruments and fibers**

ELLÆ® – Endometriosis Laparoscopic Laser Application

Endometriosis is one of the main causes in women with abdominal pain and of unfulfilled desire to have children. In women with symptoms, the primary goal is the laparoscopic removal of endometriosis lesions. Laser energy, delivered via the glass fiber optic, is used to precisely remove endometriosis lesions. Especially the resection of ovarian cysts is particularly gentle. First results of a study confirm the rapid recovery of the AMH value and the significant maintenance of the ovarian reserve*.

**Advantages**
- Working in non-contact or contact with tactile feedback
- Defined penetration depth without impact on surrounding tissue
- Preservation of ovarian reserve and fertility
- Excellent hemostasis
- Reduced scarring and avoidance of adhesions

**Applications**
- Peritoneal Endometriosis
- Ovarian Endometriosis
- Adhesiolyses
- Salpingectomy
- Cysts
- Twin-to-twin Syndrome TTTS

**Instruments and fibers**

*Study in process*
Minimally-invasive surgery

Laser surgery is also excellently suited for the treatment of condylomas or dysplasia in the areas of vulva, vagina and cervix. During conization, laser energy, delivered via the glass fiber optic, replaces the scalpel with the added benefit of excellent hemostasis. The defined penetration depth of the laser energy is less invasive, leading to fewer complications and a quick recovery of the patients.

Advantages
- Precise cutting and coagulation
- Short rehabilitation time
- Optimal protection of surrounding tissue
- Almost blood-free procedure

Applications
- Condyloma
- Conization
- Dysplasia
