

BIOLITEC® MEDICAL

Safety and performance information: Use of medical laser devices with optical fibers

Application and performance

Our medical lasers are intended for tissue treatment, in which laser light is transmitted via medical optical fibers for use in minimally invasive procedures.

Detailed performance data is available through the brochures on this website.

Safety

Medical lasers generate high-energy light that impacts the tissue. If used incorrectly, laser light can cause injury. Therefore, only qualified medical staff who have previously received training in the use of our products may perform procedures using medical lasers and fibers.

Each device includes the instruction for use, which must be strictly followed.

Please also note the national regulations regarding the appointment of a laser safety officer at your facility.
